

Digital Agents Solution for Shyft Global Services

Transforming service execution with a governed digital workforce —
Digital Agents that resolve, assist, and escalate across every service channel.

Prepared by **HyTechPro** · Strategy & Implementation Proposal

The Shift Shyft Needs

Opportunity Statement

Solution Suggested

The Result

Increase Productivity:

Enable teams to resolve customer queries faster by automating repetitive tasks, reducing manual effort, and allowing agents to focus on high-value customer interactions.

Improve Case Deflection:

Reduce the volume of support cases by empowering Digital Agents to handle common customer queries, automate FAQs, and guide users to accurate resolutions without agent intervention.

Digital Agents handle defined tasks while humans focus on judgment, exceptions, and high-impact cases.

Every action is governed, monitored, logged, and continuously improved.

Tier-1 cases auto-resolvable over time

Lower cost per AI-resolved case

Agent In Action: Customer History

WHAT IT DOES

- ✓ Pulls account & contact details
- ✓ Checks asset and service history
- ✓ Reviews warranty & entitlement
- ✓ Finds open and past cases
- ✓ Surfaces recent interactions

HOW IT WORKS

Matches the incoming case to the right customer and account, retrieves CRM and service-desk records, and connects asset, contract, entitlement and case history into one concise summary.

WHEN TRIGGERED

At the start of every case · before any entitlement-sensitive action · before escalation, scheduling or parts.

OUTPUT CREATED

Customer summary · asset profile · warranty/entitlement status · prior case history · open-issue alerts.

Better routing, fewer repeated questions, stronger customer experience and a cleaner human handoff.

Agent In Action: Routing & Triage

WHAT IT DOES

- ✓ Classifies case type
- ✓ Detects customer sentiment
- ✓ Recommends a routing path
- ✓ Scores urgency
- ✓ Identifies SLA risk

HOW IT WORKS

Reads message content and metadata, applies intent classification, checks account priority and SLA, then combines urgency, risk and confidence to assign or recommend the best resolver or queue.

WHEN TRIGGERED

Immediately after intake · when a case changes priority · when new information arrives · when escalation may be needed.

OUTPUT CREATED

Faster triage, tighter SLA control, less misrouting and higher expert productivity.

Agent In Action: Knowledge Base

Finds the right answer from manuals, SOPs, KB articles, troubleshooting guides and past cases.

WHAT IT DOES

- ✓ Searches manuals & internal knowledge
- ✓ Finds matching issue patterns
- ✓ Retrieves troubleshooting steps
- ✓ Suggests likely fixes
- ✓ Identifies knowledge gaps

HOW IT WORKS

Reads case intent and error details, searches approved knowledge sources, compares against past resolved cases, returns ranked recommendations and flags its confidence level.

WHEN TRIGGERED

When a customer asks a how-to question · when an error code is detected · when a case needs diagnosis · when a human agent needs support.

OUTPUT CREATED

Faster resolution, fewer repeat questions, better first-contact resolution and stronger knowledge reuse.

Agent In Action: Compliance & Guardrail

Ensures every AI action follows policy, entitlement, approval and data rules.

WHAT IT DOES

- ✓ Checks entitlement
- ✓ Applies policy rules
- ✓ Enforces role-based access
- ✓ Flags approval needs
- ✓ Blocks unsafe or unauthorized actions

HOW IT WORKS

Reviews each proposed action against policy, contract, entitlement and data permissions, applies confidence thresholds, and decides whether AI may proceed or human approval is required.

WHEN TRIGGERED

Before sending a response · booking service · ordering parts · writing to CRM · using sensitive data — i.e. before any autonomous action.

OUTPUT CREATED

Approved / blocked action · approval requirement · policy reason · audit record.
Safe AI execution, reduced compliance risk, clear control and enterprise trust.

Agent In Action: Spare-parts

Checks that the right part is available, compatible and ready before service is scheduled.

WHAT IT DOES

- ✓ Identifies the required part
- ✓ Checks part compatibility
- ✓ Checks inventory by location
- ✓ Reviews lead time
- ✓ Reserves or recommends ordering

HOW IT WORKS

Uses error code, asset model and case diagnosis to connect to inventory/ERP, checks availability by location, recommends a reserve or order action and flags any delay risk.

WHEN TRIGGERED

When diagnosis indicates a part is needed · before scheduling a technician · during assisted handling · when a field visit may require parts.

OUTPUT CREATED

Required part · compatibility confirmation · availability status · lead time · reserve/order recommendation.

BUSINESS IMPACT

Fewer failed visits, faster repair completion, better customer communication and less operational waste.

Agent In Action: Scheduling

Finds the right technician, expert or slot and books the service action.

WHAT IT DOES

- ✓ Checks technician availability
- ✓ Matches skill and location
- ✓ Finds available service windows
- ✓ Holds or books slots
- ✓ Suggests appointment options

HOW IT WORKS

Reads case requirement and urgency, matches skill, geography, availability and SLA against the field-scheduling system, then recommends or books the best-fit slot and prepares the customer message.

WHEN TRIGGERED

When a visit is required · when an expert call is needed · after parts availability is confirmed · when a human asks to schedule.

OUTPUT CREATED

Recommended time slot · assigned technician/expert · booking confirmation · SLA alignment · customer-ready message.

Agent In Action: Resolution & Drafting

Creates clear customer responses, troubleshooting steps and case-closure notes.

WHAT IT DOES

- ✓ Drafts customer replies
- ✓ Creates step-by-step instructions
- ✓ Writes closure notes
- ✓ Summarizes case actions
- ✓ Adapts tone and language

HOW IT WORKS

Uses case details, knowledge output, customer history and policy checks to draft a response aligned to brand and service standards, providing editable text to humans where approval is needed.

WHEN TRIGGERED

After a likely resolution is identified · when a human needs a draft · at case closure · during multilingual or tone-sensitive interactions.

OUTPUT CREATED

Customer reply · troubleshooting guide · internal note · closure summary · CRM-ready resolution note.

Faster communication, consistent customer experience, reduced agent effort and better CRM documentation.

Agent In Action: Insight & Logging

Captures structured learning from every interaction and updates the systems of record.

WHAT IT DOES

- ✓ Logs interaction details
- ✓ Updates CRM / service desk
- ✓ Captures resolution data
- ✓ Identifies knowledge gaps
- ✓ Feeds dashboards & analytics

HOW IT WORKS

Converts unstructured case activity into structured records, writes the right fields back to CRM/service desk, tags case type, root cause, action and outcome, and feeds monitoring dashboards.

WHEN TRIGGERED

Throughout the case lifecycle · at human handoff · at case closure · after resolution or escalation.

OUTPUT CREATED

CRM update · case-closure record · resolution tags · knowledge-gap insight · performance metrics.

Better reporting, cleaner CRM, stronger continuous improvement and improved future automation.

Real-Life Use Case

Real-Life Use Case

“ Our POS terminal at checkout lane 4 is showing error E-472 and will not process card payments. We need to fix it before evening rush. ”

1 Email arrives

Digital Agents detect a critical issue.

2 Triage scores it

High urgency & SLA risk flagged.

3 History pulled

Account, warranty, asset & prior cases.

4 Error matched

KB links the code to a known fault.

5 Permission checked

Entitlement & action rules confirmed.

6 Part confirmed

Spare-Parts Agent verifies availability.

7 Visit booked

Nearest qualified technician scheduled.

8 Reply drafted

Customer response prepared & sent.

9 Systems updated

CRM & analytics logged automatically.

10 Resolve or brief

High confidence → confirmed. Low → human gets full brief.

Escalation reason included

What Changes For Service Teams

Less repetitive triage

Routine tier-1 work is handled before it reaches a person.

More context at handoff

Cases arrive with history, entitlement and a recommended action.

Faster access to knowledge

Cited answers surface in context, not after a manual search.

Fewer manual lookups

History, parts and scheduling are pulled automatically.

Lower coordination effort

Parts and scheduling are orchestrated, not chased.

Time for complex issues

Experts focus on the problems only they can solve.

AI support while they work

A co-pilot assists during live case handling.

What Changes For Customers

Faster acknowledgement

Every case is received and understood immediately.

Faster answers for routine issues

Common problems are resolved on first contact.

Better-informed responses

Replies reflect history, entitlement and the right fix.

Fewer repeated questions

Customers don't re-explain what the system already knows.

Better scheduling experience

Visits are booked against real availability and parts.

Accurate repair expectations

Commitments reflect confirmed parts and lead time.

Better follow-through

Closure notes and updates are consistent and complete.

What Changes For Leadership

Visibility into case drivers

Clear view of what generates volume and why.

Automation opportunities

See which case types are ready to automate next.

SLA & escalation monitoring

Track adherence and escalation quality in real time.

Reliable performance data

Clean, structured records across every case.

Cleaner CRM / service desk

Consistent fields and tags improve every downstream report.

Stronger risk & governance control

Policy, entitlement and audit are enforced by design.

Cost-to-serve visibility

Understand and manage the true cost of each resolution.

Governance and Audit

AI Audit Framework

Audit Objective

Assess how well AI agents deliver business alignment, operational efficiency and measurable impact.

Audit Scope

Business fit, AI quality, deflection, integrations, security, sales impact, maintenance, channels and ROI.

Audit Methodology

Audit Areas and Evaluation Criteria

Business Alignment: Key use cases, % queries handled by AI

AI Performance: Containment rate, intent accuracy, failed intents

Case Deflection: Ticket reduction, FAQs automated

Integration: Orders, Cases, Accounts, real-time accuracy

Flow Quality: Optimized flows, error handling

Escalation: Smooth transfer, context passing

User Experience: Ease of use, CSAT

Security: Data privacy and protection

Sales Impact: Leads created, conversion rate

Maintenance: Updates and intent additions

Channels: Web, portal, WhatsApp coverage

ROI: Cost savings and productivity improvements

Audit Output: Pass/Fail evaluation, performance insights, identified gaps and improvement recommendations.

Conclusion: Measures Digital Agent maturity and pinpoints ways to improve efficiency, UX and ROI.

A Phase-Wi Roadmap

A phased roadmap reduces risk while expanding autonomy

Autonomy expands left → right, only as performance is proven at each decision gate

Thankyou!
