

AI Service Command Center

An elaborated fictional case study for a next-generation IT support, repair, field service, parts, and asset recovery company

The service lifecycle, made visible. The right expert, part, policy, and response, assembled by AI.

Mock company
Fictional, for campaign and sales
storytelling

Powered by Salesforce-native agentic AI

Experience Cloud

The fictional company

Aptivance is built to look like a US-style next-generation service company.

Aptivance Technology Services helps technology brands and enterprise customers manage the messy middle of service delivery: customer support, warranty claims, depot repairs, field technician dispatch, parts replacement, and asset recovery.

Support
Multi-channel case intake and help desk

Repair
Depot repair, RMA, warranty processing

Field
Technician visits and work orders

Parts
Inventory, shipment, and replacement logistics

Recovery
Secure wipe, resale, recycle, disposal

Plain-English lifecycle: Configure → Deploy → Support → Repair → Replace → Recover

In this story, Aptivance is hired by a hardware manufacturer to run service operations at scale.

The customer: VoltEdge Technologies

A fast-growing manufacturer of laptops, routers, and enterprise networking equipment.

VoltEdge sells through channel partners across North America and Europe. Sales are growing, but service operations are starting to strain.

Cases arrive from email, phone, portals, and resellers

Warranty details are incomplete or scattered

Dispatchers manually match skill, geography, SLA, and parts

Agents lose time searching manuals and internal playbooks

Leadership sees product and service issues too late

Business pressure

Retail customers rely on VoltEdge routers to keep payment systems running. A slow service response directly affects revenue, customer trust, and renewal risk.

Aptivance mandate

Create one connected service engine that can triage, inform, coordinate, protect, respond, and learn across the entire lifecycle.

The end-to-end service lifecycle

The case study follows one urgent incident from intake to operational learning.

What makes this agentic, not just automated: each AI agent makes a bounded recommendation, updates the Salesforce workflow, hands off to the next agent, and keeps humans in control for commitments, approvals, and customer-sensitive decisions.

The agent team

Eight specialized agents work together inside the AI Service Command Center.

Each agent has a narrow role, clear data inputs, defined Salesforce actions, and human approval points.

Agent roles and outcomes

A practical operating model, not a sci-fi mascot parade.

Agent	Role in the case	Outcome
Routing & Triage	Reads the incoming request, detects issue type, severity, customer impact, SLA, and product category.	Case is prioritized, summarized, and routed to the right queue.
Customer History	Pulls account, installed assets, serial number, warranty, contract, prior cases, and sentiment.	Agent starts with context and avoids asking the customer for known information.
Knowledge Base	Retrieves approved troubleshooting, warranty rules, repair instructions, and customer-safe responses.	Faster diagnosis with lower policy drift and fewer inconsistent answers.
Parts & Logistics	Checks required replacement, inventory, warehouse location, compatible alternatives, shipping ETA, and van stock.	Right part is reserved early, reducing repeat visits and SLA misses.
Scheduling	Matches technician skill, geography, availability, parts arrival, travel time, and SLA clock.	Best appointment window is recommended for dispatcher approval.
Compliance & Guardrail	Validates entitlement, sensitive data handling, approval rules, region rules, and communication limits.	Risk is caught before commitments are made to customers.
Resolution & Drafting	Drafts customer updates, internal summaries, work-order notes, escalation notes, and closure language.	Human teams respond faster with consistent, polished communication.
Insight & Logging	Captures case outcome, product trends, repeat failures, service leakage, and upsell signals.	Leadership sees actionable trends and can launch proactive service programs.

Case study begins: a critical retail outage

One message kicks off the full service lifecycle.

8:15 AM

“Payment terminals are down in three stores. We believe the routers are failing. Need urgent support.”

Revenue-impacting	Multi-location
Networking product	Premium customer
Potential part replacement	Field technician needed

The raw request is short, but the operational load is large.

Without AI, this becomes a chain of manual checks. With the command center, the request becomes a structured service plan.

Step 1: Routing & Triage Agent

Turns an unstructured request into a prioritized Salesforce case.

Inputs

Email body, customer channel, product keyword, account ID, SLA rules, impact language, location count

Agent decision

Classifies as critical networking outage affecting payment systems across three retail locations.

Salesforce action

Creates/updates case, assigns severity, starts SLA timer, routes to networking support, and alerts service manager.

Outcome

The case lands with the right team in minutes, with urgency and business impact already visible. No one has to read between the wires.

Step 2: Customer History Agent

Gives the service team the customer's full operating context.

Account profile

RetailCo, enterprise customer, premium support

Installed base

420 VoltEdge routers across 90 stores

Contract

Priority response SLA, active support agreement

Recent history

Two similar router incidents in 30 days

Relationship signal

Open renewal opportunity owned by account team

Outcome

The support team no longer treats this as an isolated ticket. The AI surfaces repeat-failure risk, account importance, entitlement, and renewal impact before anyone picks up the phone.

Step 3: Knowledge Base Agent

Retrieves approved guidance instead of making the agent hunt.

What it finds

- VX router outage checklist
- Power module troubleshooting steps
- Customer-safe explanation
- Internal escalation rule
- Warranty and RMA article

How it helps

The support agent sees the likely diagnostic path, known failure pattern, and approved customer language in one workspace.

Human control

The AI suggests. The support specialist validates, adapts, and approves the customer-facing response.

Outcome

Diagnosis becomes faster and more consistent. New agents benefit from expert knowledge without becoming policy cowboys.

Step 4: Parts & Logistics Agent

Checks whether the right replacement can reach the right place in time.

Required part: VX-900 power module

Inventory: Dallas warehouse has 12 units

Alternate: VX-900B compatible if approved

Shipping: can arrive by 10:00 AM tomorrow

Van stock: one nearby technician carries compatible unit

Backorder risk: low for this region

Salesforce actions

Reserve part, update work order, attach compatible-part note, create shipment request, and flag backorder risk if inventory changes.

Outcome

A technician is not dispatched empty-handed. First-time-fix probability improves because parts are coordinated before the appointment is promised.

Step 5: Scheduling Agent

Matches skill, location, parts arrival, and SLA into one recommendation.

Candidate 1
Angela R.

Networking certified
12 miles away
Available 1:00-3:00 PM
Part available by visit time

Candidate 2
Brian L.

General field tech
25 miles away
Available 10:00-12:00
No matching van stock

Candidate 3
Maya S.

Networking certified
42 miles away
Available 2:00-4:00
Longer travel time

Recommended plan

Assign Angela R. from 1:00-3:00 PM. She has the right skill, location advantage, and parts readiness within SLA.

Step 6: Compliance & Guardrail Agent

Prevents the team from promising what the contract, policy, or risk rules do not allow.

Entitlement
Premium support confirmed

SLA
Priority response clock active

Data sensitivity
No customer data-bearing device involved

Communication
No pricing or guarantee without approval

Escalation
Manager approval required if SLA is at risk

Audit trail
All AI recommendations logged

Outcome

The organization gets speed without recklessness. AI accelerates the workflow while keeping human approval and policy boundaries in the cockpit.

Step 7: Resolution & Drafting Agent

Prepares the words humans need, without taking humans out of the loop.

Customer update draft

“We’ve confirmed your request under the priority support agreement. A certified networking technician is being scheduled with the required replacement part. We’ll share the appointment window shortly.”

Internal summary

Critical multi-store retail outage. Premium support confirmed. VX router power module suspected. Part identified in Dallas inventory. Recommended dispatch: Angela R., 1:00-3:00 PM.

Closure note draft

Technician replaced failed power module, validated payment terminal connectivity, confirmed all three stores operational, and linked case to emerging VX-900 trend.

Outcome

Customer communication becomes faster, clearer, and more consistent while human approval remains mandatory for commitments, exceptions, complaints, and sensitive issues.

The incident timeline

A clear before-lunch recovery story for the case study.

Result

A fragmented, urgent outage is converted into a coordinated field response with verified entitlement, correct parts, skilled technician assignment, approved communication, and post-resolution learning.

Step 8: Insight & Logging Agent

The incident does not disappear when the case closes. It becomes operational intelligence.

VX-900 power module cases increased across retail accounts

Three affected stores share same deployment batch

Repeat failure pattern found across two other regions

Potential proactive replacement campaign identified

Account manager notified because renewal is active

Product team receives trend package for investigation

Outcome

Aptivance moves from reactive support to proactive service. Leadership sees what is breaking, where it is breaking, which customers are affected, and what action should happen next.

Lifecycle value creation

The command center improves every stage, not only the ticket.

Configure	Known asset, serial, and contract data captured early	Cleaner service records later
Deploy	Install base mapped to customer locations	Faster issue localization
Support	AI triage, context, knowledge, and drafting	Shorter response time
Repair	Parts, RMA, warranty, and depot workflow connected	Reduced repeat handling
Field	Skill, geography, parts, and SLA aligned	Higher first-time-fix probability
Recover	Asset return, secure wipe, resale/recycle workflows tracked	Better compliance and cost recovery

The AI layer is most valuable when it connects the whole service chain, not just one isolated task.

Expected business outcomes

The deck should sell outcomes, not “AI glitter.”

Faster

case triage and first response

Higher

first-time-fix probability

Lower

SLA and compliance risk

Better

visibility for leaders

Reduced manual coordination across support, warranty, parts, dispatch, and repair teams

More consistent customer communication through human-approved drafts

Earlier parts validation, reducing wasted truck rolls and repeat visits

Real-time product and account trends for proactive service programs

Stronger renewal and expansion conversations with proof of service quality

Salesforce architecture fit

Where AblyPro brings the system to life.

Service Cloud	Cases, queues, SLAs, knowledge, agent workspace	Sales Cloud	Renewal, expansion, and account-team visibility
Field Service	Work orders, dispatch console, technician scheduling	Agentforce / Einstein AI	Agent actions, summaries, recommendations, drafting
Data Cloud	Unified account, asset, entitlement, and service profile	MuleSoft / Integrations	ERP, inventory, shipping, warranty, depot, partner systems
Experience Cloud	Customer and partner portals for intake and status		

AblyPro implementation role
Design the agent model, connect Salesforce workflows, define guardrails, integrate data sources, build dashboards, and pilot the first high-value service journey.

Recommended pilot roadmap

A pragmatic way to move from concept to measurable value.

Final positioning
Aptivance shows how a next-generation service company can use agentic AI to turn fragmented service delivery into a coordinated command center, built on Salesforce and implemented by AblyPro.
